

CONDITIONAL RENDERING

Back to react

IF STATEMENT

At times you want to render components on the screen depending on particular state of variable, ie isLoggedIn

```
Function render(){  
  If (isLoggedIn){  
    return <h1> welcome <h1>  
  
  }else{  
  
    return <LoginForm />  
  
  }
```

TERNARY OPERATORS

If statements don't work well in functional programming,
Something react particularly prefers inside components.

Thus we have ternary operators:

Condition? DO IF TRUE: DO IF FALSE

Example

```
isLoggedIn === true? <h1> Hello world</h1>: <LoginForm />
```

```
isLoggedIn? <h1> Hello world</h1> : <LoginForm />
```

&&

What happens when there is no else???

(Condition && EXPRESSION)

Case 1:

(true && EXPRESSION) - the expression is rendered.

Case 2:

(false && EXPRESSION) - the expression is not rendered
